

# Continuous Innovation

## - *The Art of Set-Based Thinking™* -

**Michael Kennedy**

Co-Founder / CEO

**Targeted Convergence Corporation**

# Here are some definitions (for this presentation only)

- An ***'idea'*** is a novel approach for doing something. Ideation is a process for achieving.
- An ***'invention'*** is the manifestation of an idea into something real.
- An ***'innovation'*** is an invention that realizes customer value with an economic benefit.

# Otto Lilienthal: A great inventor

- Called the father of Flight
- Successfully designed and flew gliders in mid 19<sup>th</sup> century
- Published “lift / Drag” data

*“ To invent an airplane is nothing, to build one is something, to fly is everything”*

# Samuel Langley: ??????

- Using Lilienthal's data, successfully designed and tested several gliders
- Funded by U.S. War department, designed this system for manned flight
- It ended up in the river

# How about the Wright Bros?

Invented

- A wind tunnel for measuring lift and drag – corrected Lilienthal's data
- Wing warping technology for flight control
- A highly efficient propeller
- A lightweight engine
- Their inventions spawned an entire industry

# What is lean?

- Lots of definitions; but can we all agree, it will always include “Continuous Improvement”
- Can we also agree, for Product Development, it would include “Continuous Innovation”
- Another question: “What is the relationship between ‘lean’ and ‘innovation’?”
  - Complementary, adversarial

# Lean vs. Innovation

## *The case for Adversarial:*

- lean is about setting standards / reducing variability
- Innovation is about breaking standards and increasing variability

## *The case for Complementary:*

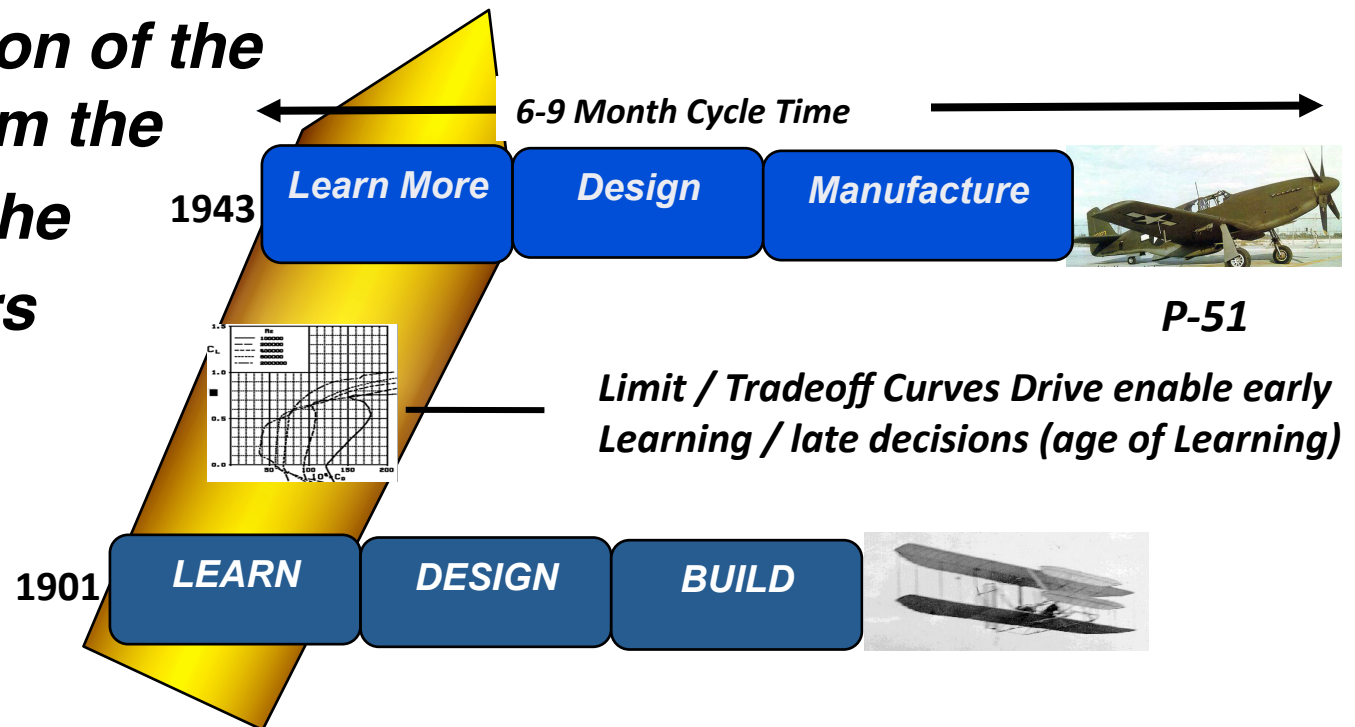

- lean is about establishing a baseline (standard)
- Measuring the baseline
- Continuously innovating to improve the baseline

# Were the Wright Brothers Lean?

(we know they were great innovators)

## Consider the P51 Mustang

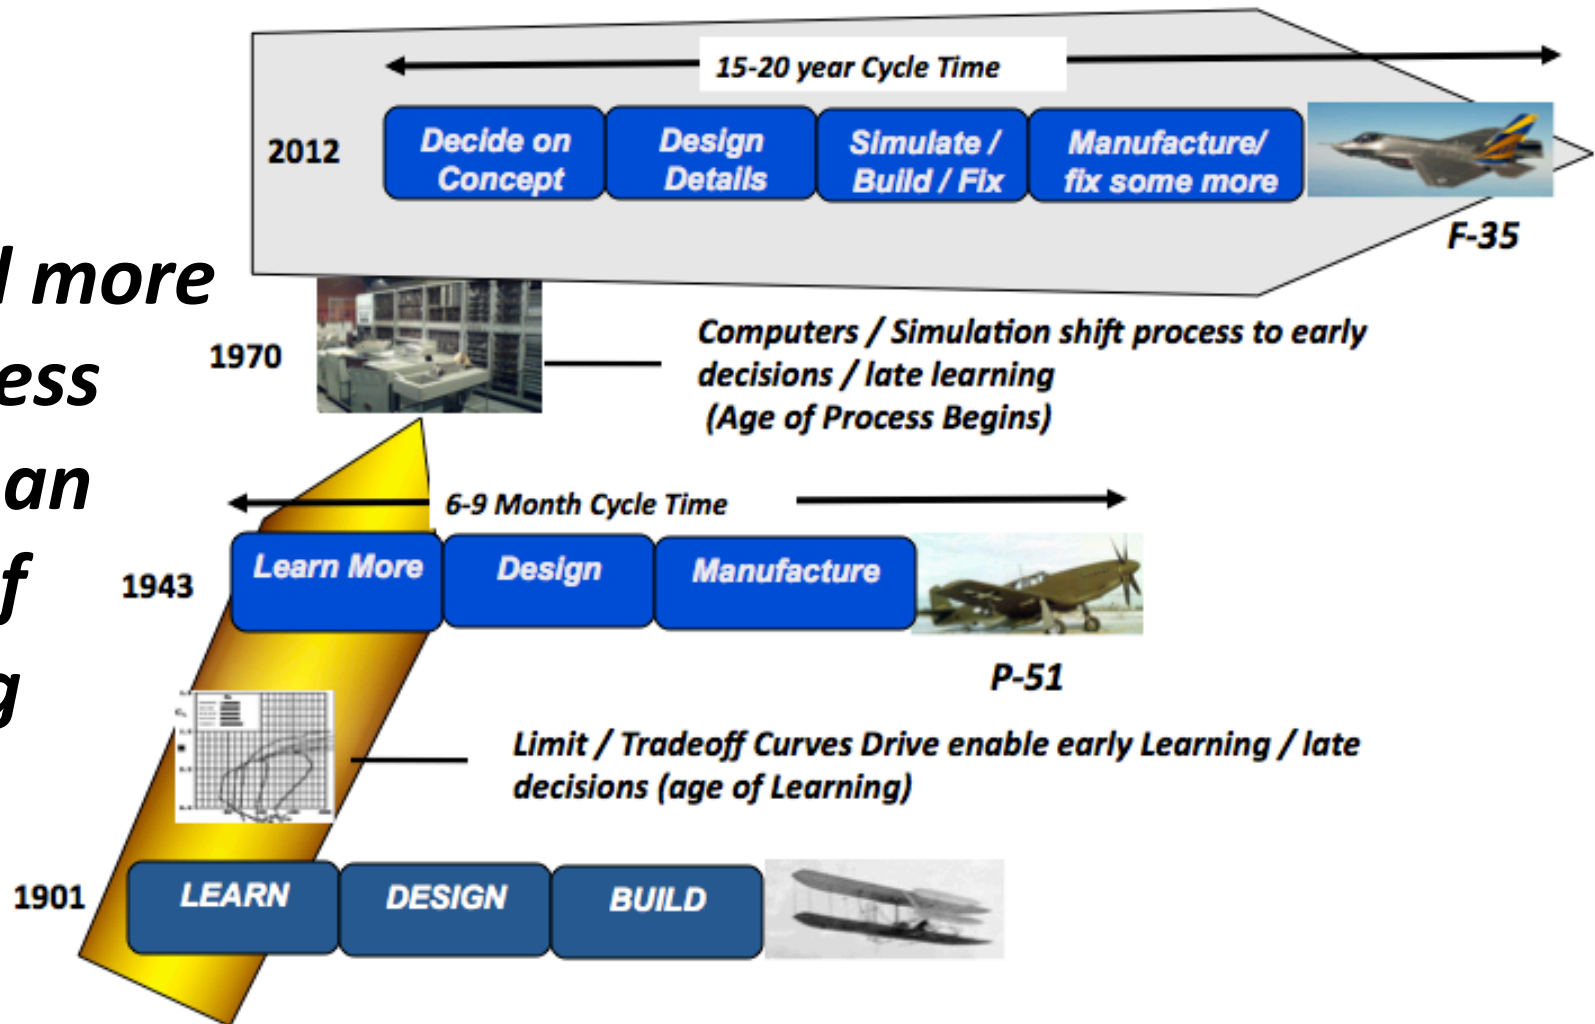

- *Direct evolution of the knowledge from the inventions of the Wright brothers*

# The aircraft industry today

*Focused more on process tasks than cycles of learning*

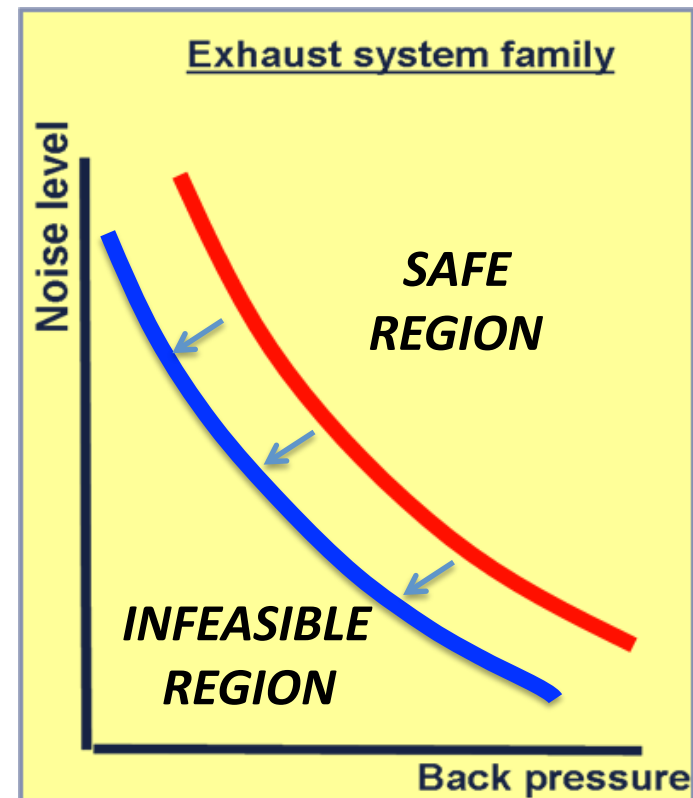

# Is Toyota Innovative?

## (we know they are lean)

- Many say they are not; point to 'boring' styling; breakthrough new models few and far between
- However, consider they seldom yield the lead:
  - The Lexus and Prius look largely the same, but are still market leaders after 25 and 15 years
  - How?: they follow the lean principles of continuous innovation to stay ahead

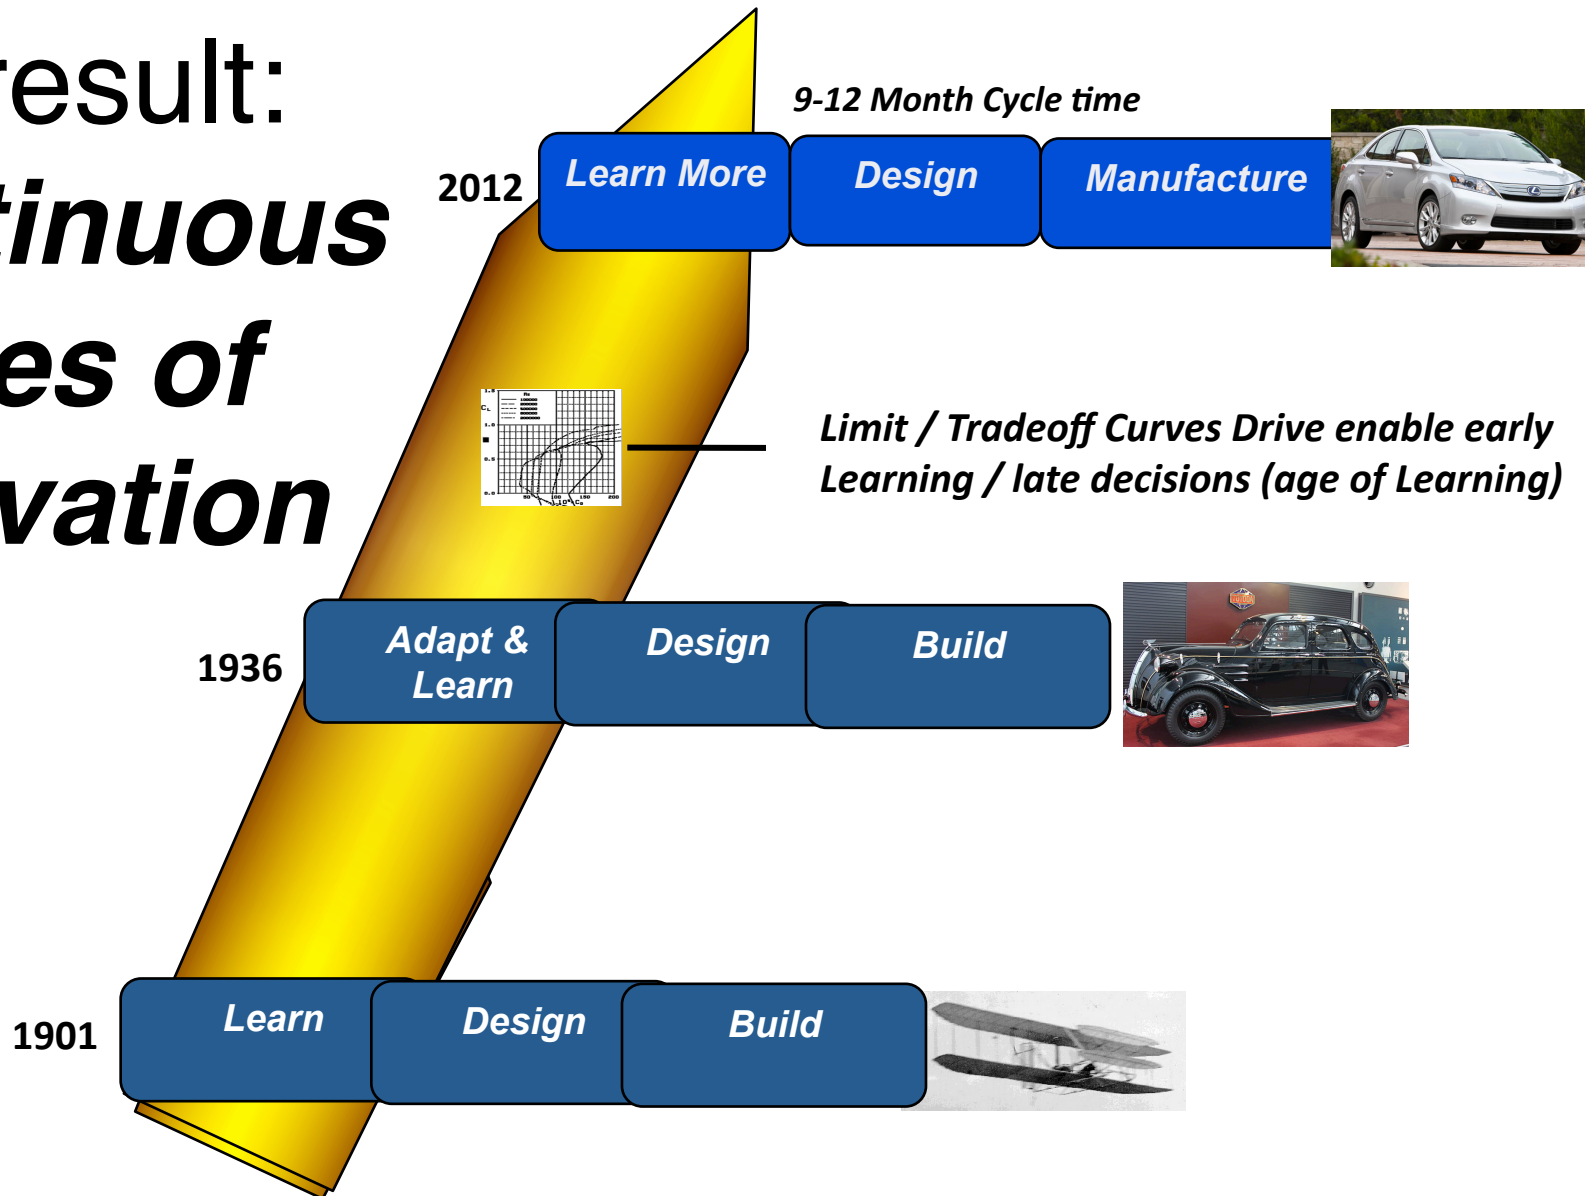

# What has Toyota taught us about continuous innovation

- Focus on decisions and customer interests
- Know the limits of current capability (baseline)
- Design within it today
- Relentlessly move the limits for tomorrow

**WHAT IF YOU DID THAT ON EVERY DECISION?**

# The result: *Continuous Cycles of innovation*

# Let's consider PING™

*A small company competing  
in a land of giants*

Over the last decade:

- 5X in new products introduced
- Reduced TTM by 50%
- with 20% less people

# They relentlessly focus on performance limits

## PING P3 Limit Curve

### CGx vs. Trajectory

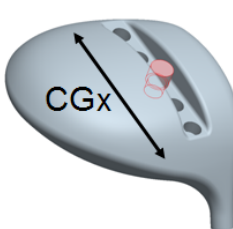

**Nugget:** By moving the CGx (heel/toe) on a driver, shot bend is influenced by  yards/" of CG movement and offline is influenced by  yards/" CG movement for drives of  yards.

Document Owner: <input type="text"/>	Date: <input type="text"/>	ID#: 390	Description: CGx Ball Flight Effect on Drivers	Project: Pull Innovation
--------------------------------------	----------------------------	----------	--	--------------------------

**Problem Statement:**  
Develop a trade-off for Ball Flight Performance vs. CGx (heel/toe direction).

**Description of the Test/Analysis:**  
A driver was made with a channel in the X-axis through the head's natural center of gravity. A  gram tungsten weight could then be screwed into the head and move the center of gravity by +/- " (" total range). This club was hit on PING Man and by players in a Player Test. The results are shown in the graphs to the right.

Variable CGx Driver (shown in CG center position)

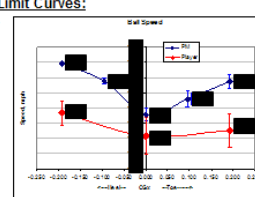

**Results:**  
The most valuable and applicable results from this test are the trade-offs for CGx vs. Spin Axis, Offline, and Shot Bend. The following trade-offs can be used for design optimization and research purposes for drivers, noting that the offline and shot bend are for shots that are  mph ball speed and  yard carry.

- Spin Axis =  degrees / " CGx
- Shot Bend =  yards / " CGx
- Offline =  yards / 0 " CGx

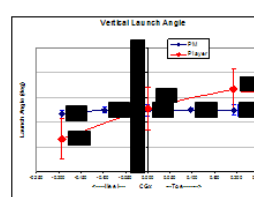

**Limit Curves:**

**Ball Speed**

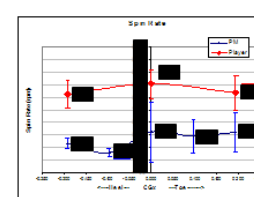

Inconclusive due to structural design of prototypes

**Vertical Launch Angle**

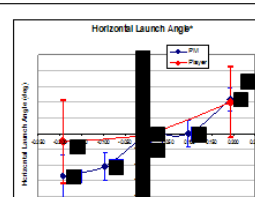

Player: LA =  / 0  CGx

**Spin Rate**

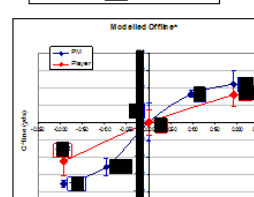

Spin =   CGx

**Horizontal Launch Angle**

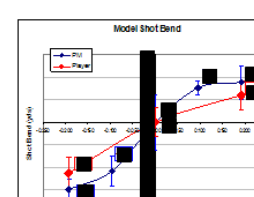

Player: Horizontal LA =  deg / " CGx  
PM: Horizontal LA =  deg / " CGx

**Modelled Offline**

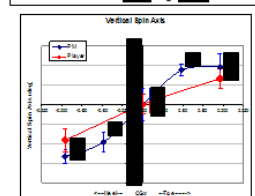

Player: Offline =  yds / " CGx  
PM: Offline =  yds / " CGx

**Model Shot Bend**

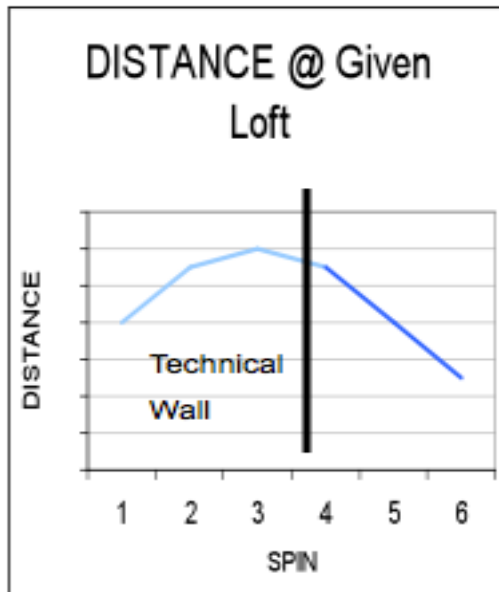

Player: Shot Bend =  yds / " CGx  
PM: Shot Bend =  yds / " CGx

**Vertical Spin Axis**

Player: Spin Axis =  deg / " CGx  
PM: Spin Axis =  deg / " CGx

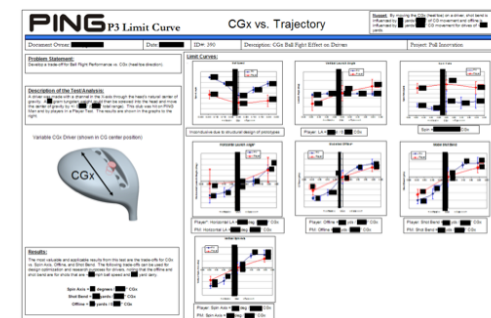

# They move limits on Decisions

*We need to move the wall*

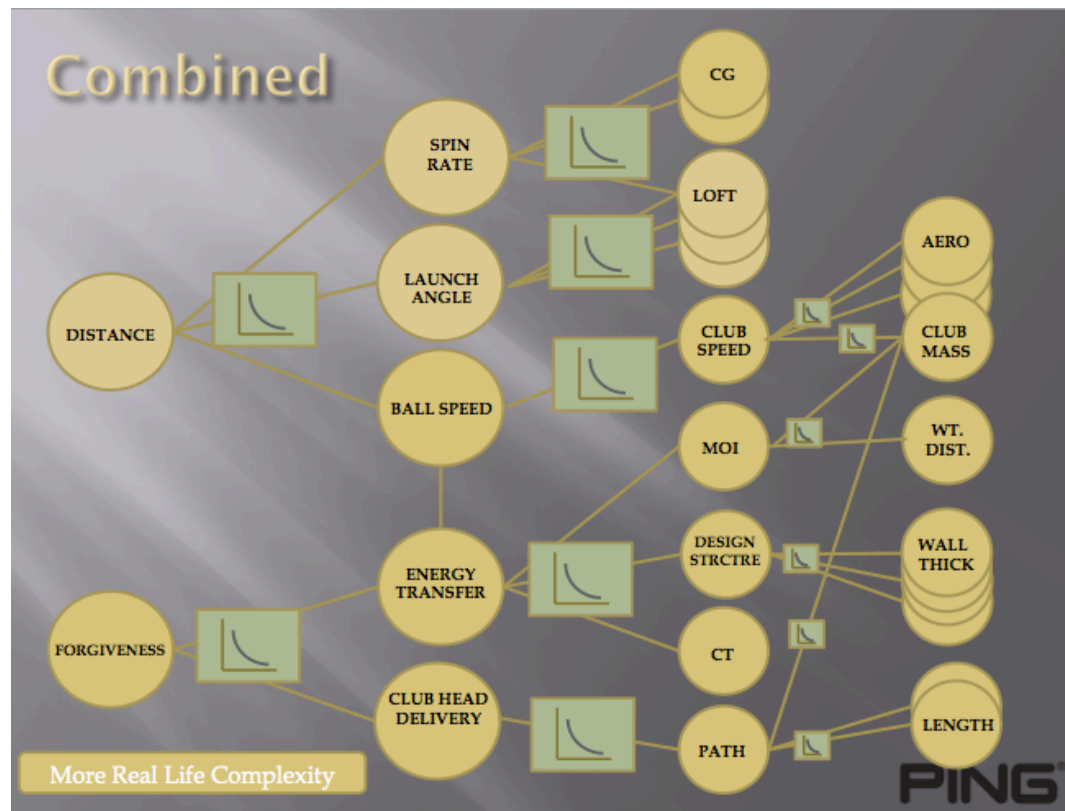

*By removing the technical restrictions*

*Then setting the new baseline*

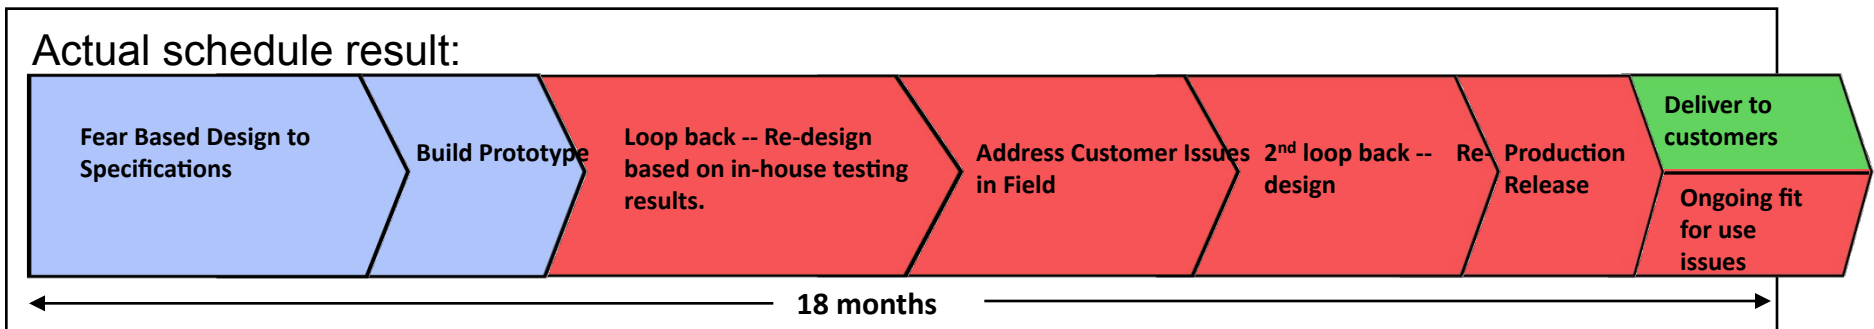

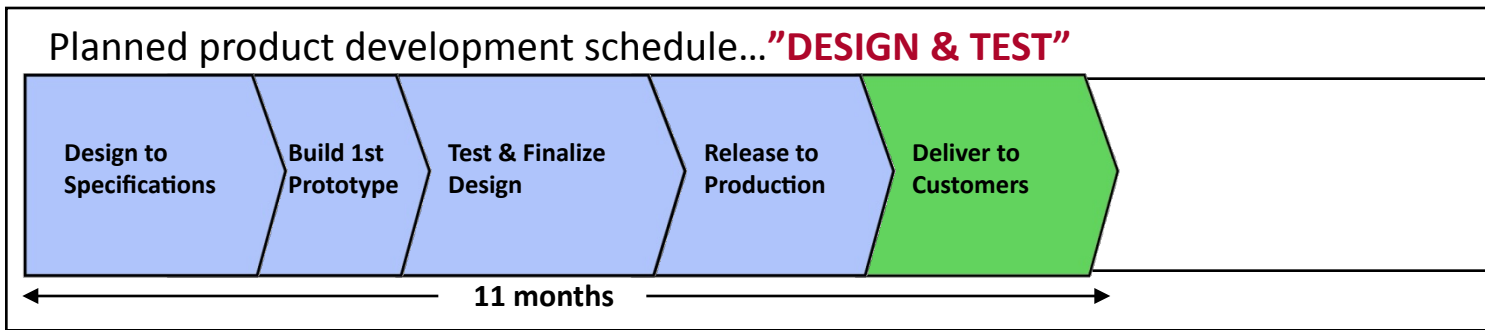

# This allows continuous system innovation

# The Teledyne Benthos Story

1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18

**Traditional Specification Driven Design**

# Teledyne Benthos: They changed the process

*What does the customer want?*

**Customer Interest Aseptic Dairy for Shelf Stability .006 leaks @ 220 feet/minute Target price under \$60,000**

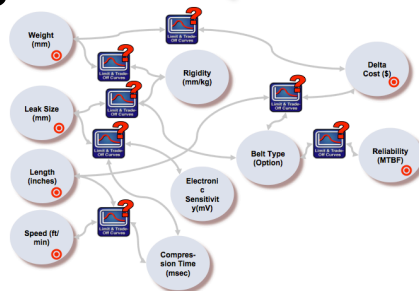

Customer interest researched by TapTone Engineers

*Can we innovate and extend the limits?*

*Are our knowledge limits captured?*

*What are the tradeoffs / gaps?*

*Can we resolve the gaps?*

*Is the product optimized?*

# They now dominate

1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18

Schedule based on **KNOWLEDGE**

←Existing Knowledge Base

High pressure aerosol can leak detection developed in 6 months

©2001 HowStuffWorks

Next Design Iteration started with established knowledge base

Product development cycle reduced from 18 months to under 9 months

# Is there a common ground?

- All understood their customer interests
- All knew their capabilities / limits
- All knew the needed decisions and the tradeoffs
- All defined / resolved the knowledge gaps
- All optimized the design and established new baselines

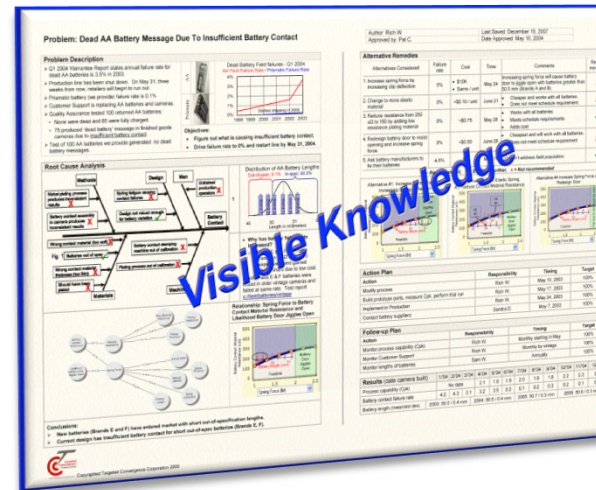

# Are there simple models to build from for continuous innovation?

From the President of Toyota North America:

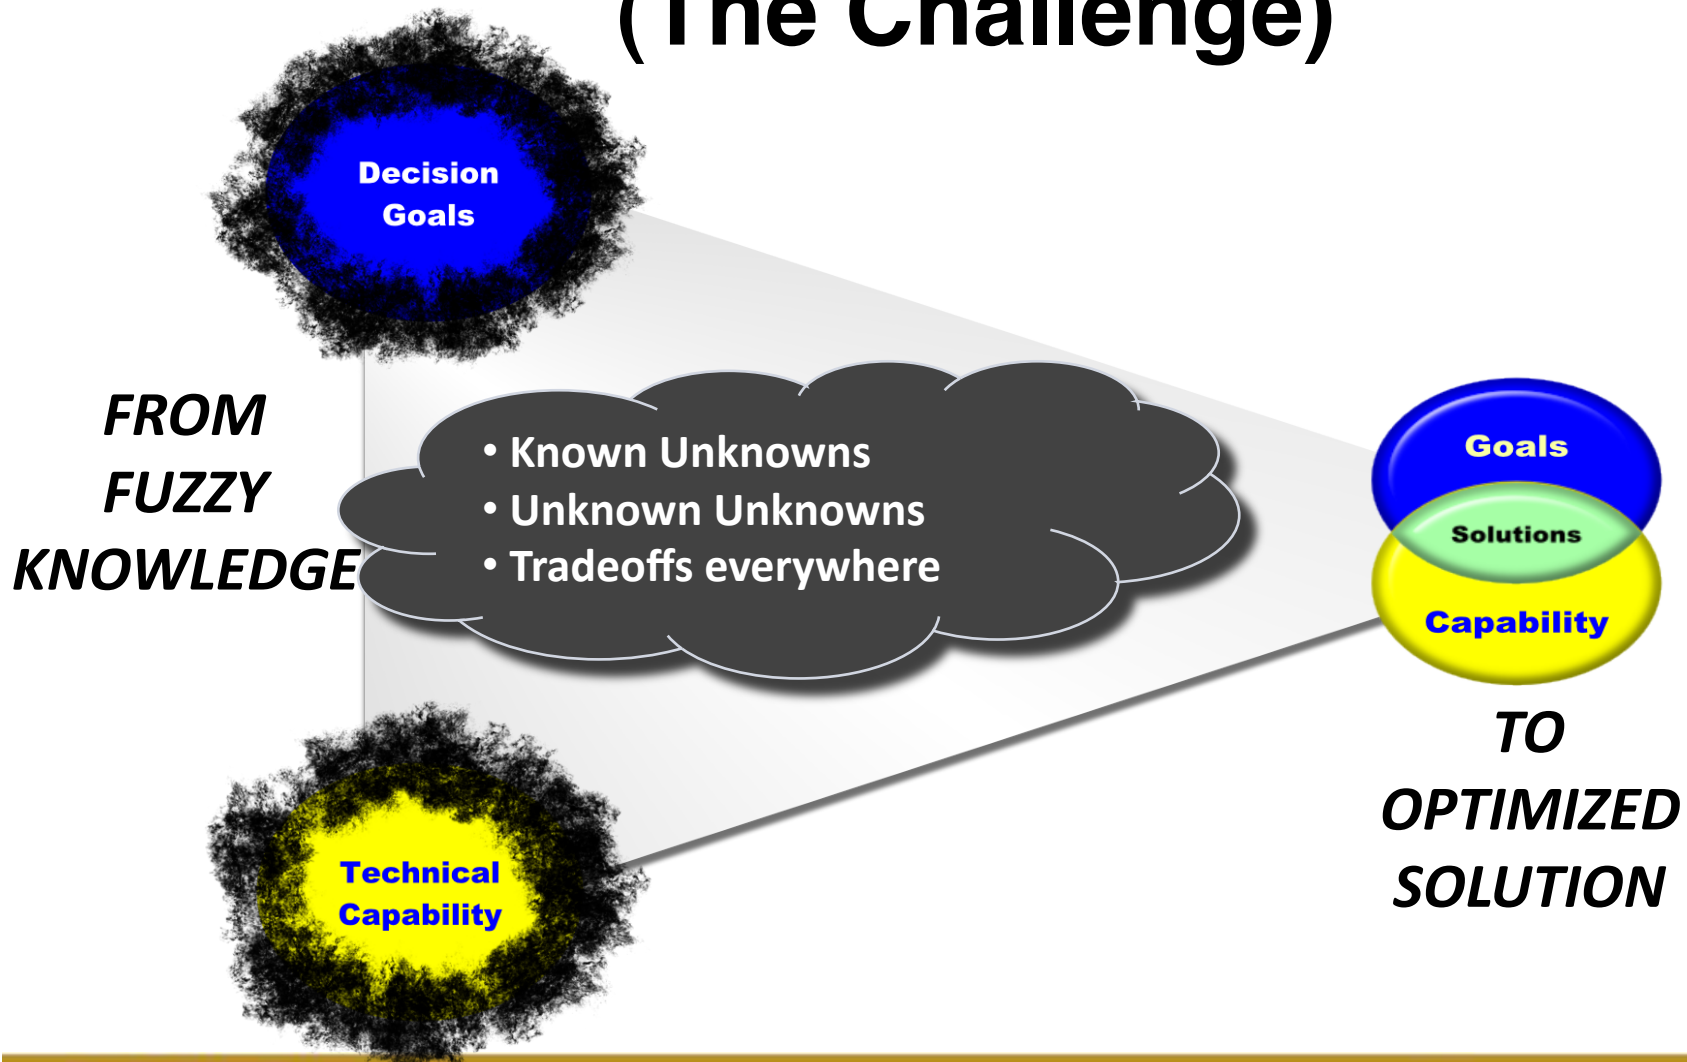

- *Keep it simple*
- *Make everything visual*
- *Trust your people to do the right thing*

# 1: The Learning Model

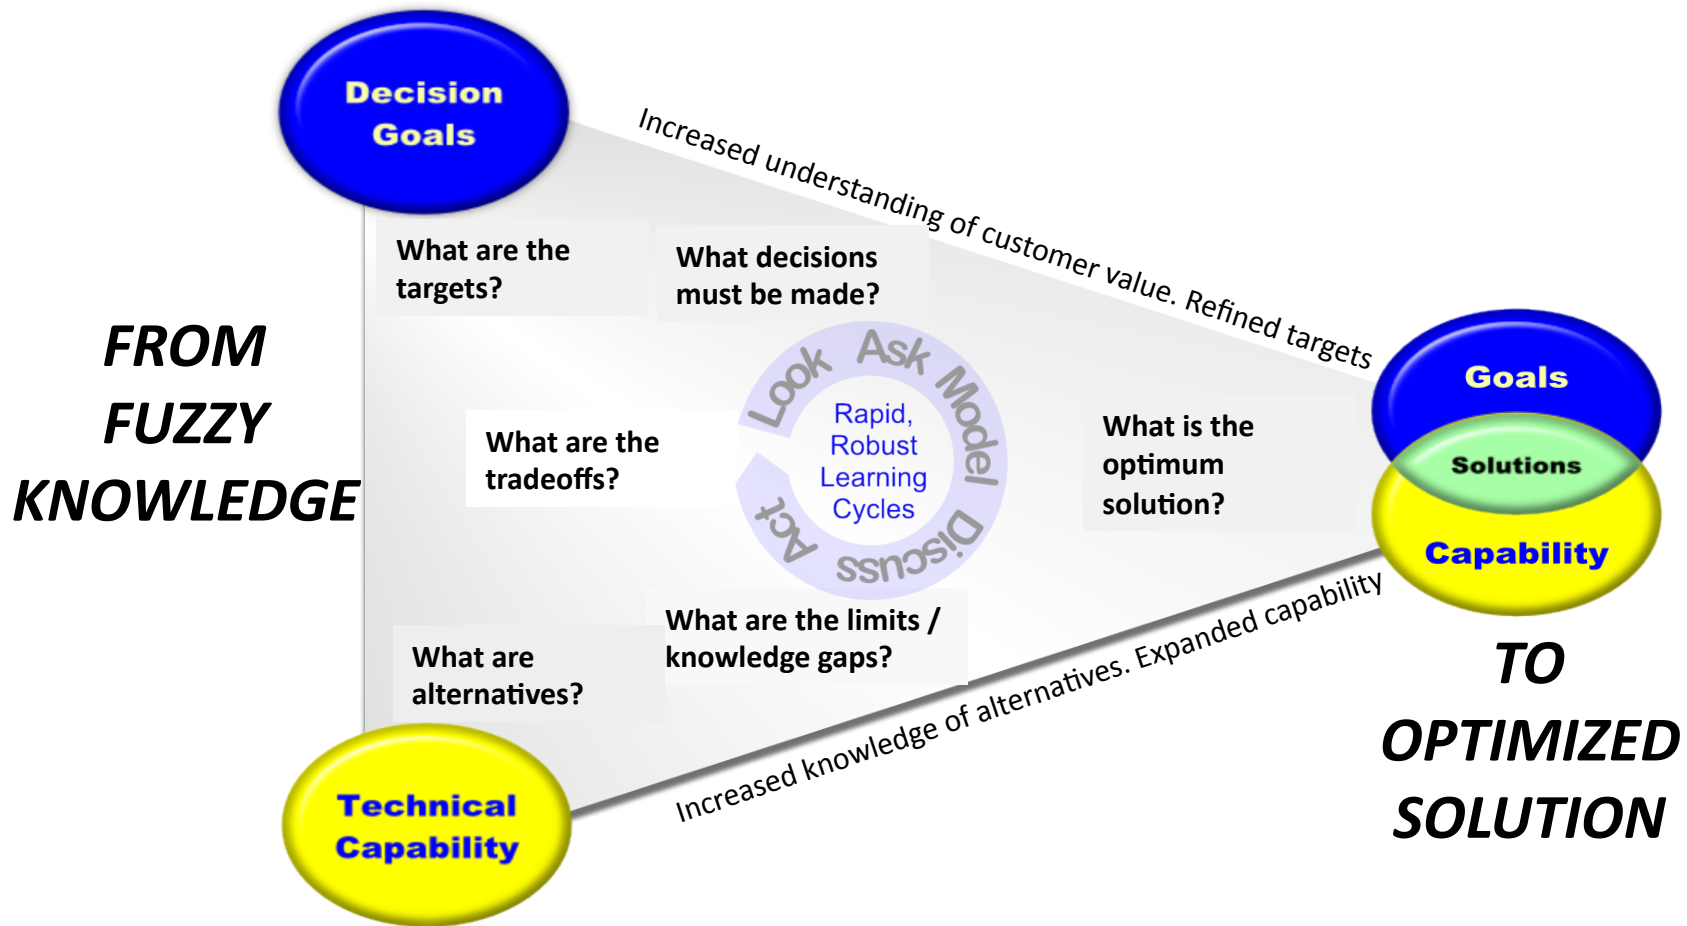

- At Toyota, it is the A3 and the relentless learning to produce it
- Dr. Allen Ward created the term LAMDA for simplicity and focus

# 2: The Set-Based Convergence Model (The Challenge)

# 2: The Set-Based Convergence Model (Cycles of focused Learning)

# Let me end with some questions

Before you start designing a new product

- Do you really know your customer interests and targets – *or do you assume they are in the specs?*
- Do you really know the limits of your capability?
- Do you know the tradeoffs?
- Are you innovating to remove / extend performance limits?
- Are your innovations the new ‘capability’ baseline for your next product?

# Thank You!

**Continuous Innovation**
